

# Python Assignment

## While Loop and while with else (Data Analysis Practice)

---

**Instructions:** Write a Python program for each question using a while loop. Run it and check the output. For the "Predict the output" question, write your answer first and then verify it by running the code.

### Part A: While Loop

1. Print the text "Day 1", "Day 2", ... up to "Day 7" using a while loop.

2. The daily sales of a shop for 5 days are stored in a list:

```
sales = [1200, 1500, 900, 2000, 1800]
```

Print each day's sales one by one using an index.

3. Using the same sales list, find and print the total sales.

4. The marks of 5 students are given below. Calculate and print the average marks.

```
marks = [45, 78, 62, 90, 55]
```

5. Using the same marks list, count how many students scored 50 or more (passed). Print the count.

6. A product costs ₹25. Take the quantity from the user and print the cost for 1 item, 2 items, 3 items ... up to the given quantity. (Example for quantity 3: 25, 50, 75)

7. Find the highest value in the following list using a while loop (do not use max()):

```
temperatures = [31, 34, 29, 36, 33]
```

### Part B: While with else

8. Print the month numbers 1 to 3 using a while loop. After the loop finishes, print "Report Generated" using an else block.

9. A list of customer IDs is given:

```
ids = [101, 102, 103, 104]
```

Print each ID using a while loop, and then print "All customers listed" using an else block.

## Part C: Predict the Output

**10.** Predict the output, then verify by running the code:

```
i = 1
total = 0

while i <= 4:
    total = total + i
    i += 1
else:
    print("Loop Finished")

print(total)
```
